## Units in magnetism

Table A.1: Units in the SI system and the cgs system. The abbreviations are $\mathrm{m}=$ metre, g=gramme, $\mathrm{N}=$ Newton, $\mathrm{J}=$ Joule, $\mathrm{T}=$ Tesla, $\mathrm{G}=$ Gauss, $\mathrm{A}=\mathrm{Amp}$, Oe=Oersted, $\mathrm{Wb}=$ Weber, $\mathrm{Mx}=$ Maxwell. The term emu is short for 'electromagnetic unit' and is not a unit in the conventional sense. It is sometimes used as a magnetic moment ( $1 \mathrm{emu}=1 \mathrm{erg} \mathrm{G}^{-1}$ ) and sometimes takes the dimensions of volume ( $1 \mathrm{emu}=1 \mathrm{~cm}^{3}$ ).

| Quantity | symbol |  | SI unit |  | cgs unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Length | $x$ | $10^{-2}$ | m | $=1$ | cm |
| Mass | $m$ | $10^{-3}$ | kg | $=1$ | g |
| Force | $F$ | $10^{-5}$ | N | $=1$ | dyne |
| Energy | E | $10^{-7}$ | J | $=1$ | erg |
| Magnetic induction | B | $10^{-4}$ | T | $=1$ | G |
| Magnetic field strength | H | $10^{3} / 4 \pi$ | $\mathrm{Am}^{-1}$ | $=1$ | Oe |
| Magnetic moment | $\mu$ | $10^{-3}$ | $\begin{aligned} & \mathrm{JT}^{-1} \\ & \text { or } \mathrm{Am}^{2} \end{aligned}$ | $=1$ | $\operatorname{erg} G^{-1}$ <br> or emu |
| Magnetization <br> (= moment per volume) | M | $10^{3}$ | $\begin{aligned} & \mathrm{Am}^{-1} \text { or } \\ & \mathrm{J} \mathrm{~T}^{-1} \mathrm{~m}^{-3} \end{aligned}$ | $=1$ | Oe or emu cm ${ }^{-3}$ |
| Magnetic susceptibility | $\chi$ | $4 \pi$ | $\times 1$ | $=1$ | $\begin{aligned} & \text { emu cm }{ }^{-3} \text { or } \\ & \text { emu cm } \\ & \mathrm{Oe}^{-3} \mathrm{Oe}^{-1} \end{aligned}$ |
| Molar susceptibility | $\chi_{\mathrm{m}}$ | $4 \pi \times 10^{-6}$ | $\mathrm{m}^{3} \mathrm{~mol}^{-1}$ |  | $\begin{aligned} & \text { emu mol }{ }^{-1} \text { or } \\ & \text { emu mol } \\ & \mathrm{Oe}^{-1} \end{aligned}$ |
| Mass susceptibility | $\chi \mathrm{g}$ | $4 \pi \times 10^{-3}$ | $\mathrm{m}^{3} \mathrm{~kg}^{-1}$ |  | $\begin{aligned} & \mathrm{emu} \mathrm{~g}^{-1} \text { or } \\ & \mathrm{emu} \mathrm{~g}^{-1} \mathrm{Oe}^{-1} \end{aligned}$ |
| Magnetic flux | $\phi$ | $10^{-8}$ | $\begin{aligned} & \mathrm{Tm}^{2} \\ & \text { or } \mathrm{Wb} \end{aligned}$ | $=1$ | $\begin{aligned} & \mathrm{G} \mathrm{~cm}^{2} \\ & \text { or } \mathrm{Mx} \end{aligned}$ |
| Demagnetization factor | N |  | $0<\mathrm{N}<1$ |  | $0<\mathrm{N}<4 \pi$ |

Though not an SI unit, the Bohr magneton $\mu_{B}=9.274 \times 10^{-24} \mathrm{~J} \mathrm{~T}^{-1}$ is a useful measure of magnetic moment since it corresponds to the magnetic moment of a 1 s electron in hydrogen. For a paramagnet, the molar susceptibility $\chi_{\mathrm{m}}$ is given by Curie's law which is in SI units

$$
\begin{equation*}
\chi_{\mathrm{m}}=\frac{\mu_{0} N_{\mathrm{A}} \mu_{\mathrm{eff}}^{2} \mu_{B}^{2}}{3 k_{B} T} \tag{A.1}
\end{equation*}
$$

where $N_{\mathrm{A}}$ is Avogadro's number. Hence $\chi_{\mathrm{m}} T$ is independent of temperature and this can be related to the effective moment. Hence by rearranging equation A.1, one has $\mu_{\text {eff }}=\left[3 k_{B} / \mu_{0} N_{\mathrm{A}} \mu_{B}^{2}\right]^{1 / 2} \sqrt{\chi_{\mathrm{m}} T}$, so that

$$
\begin{align*}
& \mu_{\mathrm{eff}}=797.8 \sqrt{\chi_{\mathrm{m}}^{\mathrm{SI}} T} \approx 800 \sqrt{\chi_{\mathrm{m}}^{\mathrm{SI}} T}  \tag{A.2}\\
& \mu_{\mathrm{eff}}=2.827 \sqrt{\chi_{\mathrm{m}}^{\mathrm{cgs}} T} \approx \sqrt{8 \chi_{\mathrm{m}}^{\mathrm{cgs}} T} \tag{A.3}
\end{align*}
$$

where $\mu_{\mathrm{eff}}$ is measured in Bohr magnetons per formula unit, $\chi_{\mathrm{m}}^{\mathrm{SI}}$ is measured in $\mathrm{m}^{3} \mathrm{~mol}^{-1}$, and $\chi_{\mathrm{m}}^{\mathrm{cgs}}$ is measured in emu mol ${ }^{-1}$. These numerical relationships can be useful for extracting effective moments from graphs of $\chi_{\mathrm{m}} T$ against $T$.
