ics in Nanostructures,
y 2023

WHAT ARE WE IMAGING IN MAGNETS?

Pierre Weiss, 1907

Magnetic materials appear “non-magnetic”

→ presence of magnetic domains

CONFIRMED WITH FIRST MAGNETIC MICROSCOPY: THE BITTER METHOD

Put ferrofluid on top of a magnet

R. Patton, K. Strnat (1963)

Lemos et al., Materials Science Forum Vol. 802 (2014)

NOWADAYS...

MAGNETIC MICROSCOPY PLAYS KEY ROLE!

Wang et al., Nature (2006)

Matsumoto et al., Science Advances (2016)

Donnelly et al., Nature 547, 328 (2017)

Chmiel et al., Nature Materials 17, 581 (2018)

Soldatov & Schäfer, Rev. Sci. Instrum. (2017)

RELEVANT LENGTHSCALES

- We know these are on the order of nanometres to micrometres
- So we need spatial resolution of our microscope to be on that order

MAGNETIC MICROSCOPY: HOW DO WE CHOOSE OUR METHOD?

MAGNETIC MICROSCOPY: SCANNING PROBE TECHNIQUES

MAGNETIC FORCE MICROSCOPY (MFM)

Scan an oscillating cantilever with magnetic tip over surface of a sample

First pass: get topography

(van der Waals)

MFM
Pass I

Second pass lifted higher:

get long-range magnetic

MFM
Pass II

Kasakova et al., Journal of Applied Physics 125, 0

Tip acts as a dipole moving in a gradient of magnetic field:

Tip-sample interactions change the cantilever oscillation, observed as a phase shift in the oscillation

MAGNETIC MICROSCOPY: X-RAYS

X-rays: X-ray magnetic circular dichroism
Circular polarised light: angular momentum $\pm\hbar$

This time, resonant!

- Element specific
- Can penetrate thicker samples

Stöhr & Siegmann, Magnetism, From fundamentals to Nanoscale Dynamics, Springer (2006)

ELECTRON IMAGING

OBSERVING DOMAINS: MAGNETO-OPTICS

Circular polarised light:

Angular momentum = $\pm\hbar$

Coupling of the photon's angular momentum to angular momentum of an electron

Dichroism: Refractive index dependent on: Circular polarisation and Direction of magnetisation

Circular polarised light: Superposition of linear H and V

$$|\pm\rangle = \frac{1}{\sqrt{2}}(|H\rangle \pm |V\rangle)$$

Linear polarised light: Superposition of circular C+ and C-

$$|H\rangle = \frac{1}{\sqrt{2}}(|+\rangle + |-\rangle)$$

Donnelly et al., PRB 94, 064421 (2016)

Chmiel et al., Nature Materials 17, 581 (2018)

Soldatov & Schäfer, Rev. Sci. Instrum. (2017)

AIM OF TODAY: WE'LL FILL OUT...

	Probing B			Probing m		+
	MFM	Nitrogen vacancy	TEM	MOKE	XMCD (synchrotron)	XMLD (synchrotron)
Contrast						
Spatial resolution						
Depth sensitivity						
Sample environment						
Invasive						
Sensitivity						
Cost/ accessibility						

WE CAN THINK ABOUT WHAT IS PROBED:

Magnetic induction (B) probes

$$B = \mu_0(M + H)$$

Magnetisation (M) probes

Electrons, scanning probe, Bitter method...

Magneto-optics, spin-polarised STM, SEM with polarisation analysis

Scanning probe

Electrons

Optical regime

Electrons

X-rays

***B* probes**

***M* probes**

$$B = \mu_0(M + H)$$

Scanning probe

***Electron
microscopy***

SCANNING PROBES OF B: MAGNETIC FORCE MICROSCOPY

Cantilever with magnetic tip

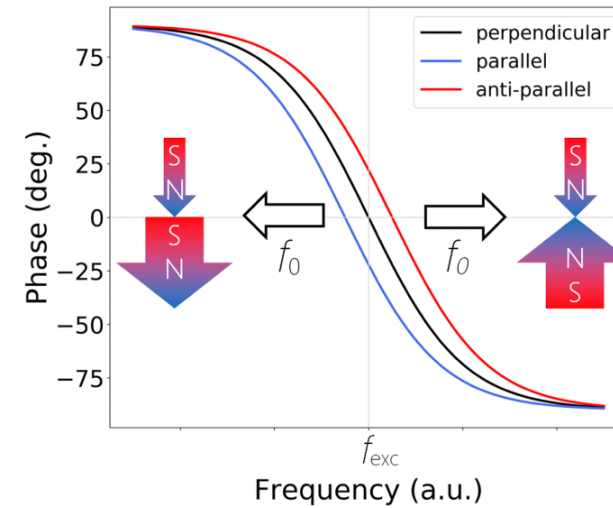

MAGNETIC FORCE MICROSCOPY:

What are we measuring? Magnetic field above the sample!

sample with magnetic domains

Credit: Nanosurf AG

MAGNETIC FORCE MICROSCOPY

Scan an oscillating cantilever with magnetic tip over surface of a sample

First pass: get topography
(van der Waals)

Second pass lifted higher:
get long-range magnetic

Tip: **dipole moving in a gradient of magnetic field**

Tip - sample interactions change the cantilever oscillation, observed as a phase shift in the oscillation

Spatial resolution: determined by tip.
Roughly 50 nm (down to ~10 nm)

Measure surface charges

& buried configuration!

* Long range interaction

Kasakova et al., Journal of Applied Physics **125**, 060901 (2019)

MAGNETIC FORCE MICROSCOPY

Nanomagnet arrays:

Wang et al., Nature (2006)

Patterned magnetic micro/nanostructures:

Magnetic vortices

Shinjo et al., Science (2000)

Magnetic domains, skyrmions:

Duong et al., APL (2019)

MAGNETIC FORCE MICROSCOPY

Take Home Messages of MFM

- High spatial resolution imaging of magnetic surface charges
- Tip can interact with sample surface – change state, control sample!

- Limited to ~flat samples – could need higher sensitivity –

	MFM
Contrast	H , surface charges
Spatial resolution	10s of nm
Depth sensitivity	Surface sensitive
Sample environment	Field, cryo, electrical contacts
Invasive	Yes
Sensitivity	Medium
Cost/ accessibility	Lab-based, accessible

SCANNING PROBES OF B: NITROGEN VACANCY MICROSCOPY

Maletinsky et al., Nat. Nano., 7, 320 (2012)

- Diamond tip, with a defect in the lattice:
- Defect behaves as an artificial atom
- Spin triplet ground state
 - Magnetic sensitivity & long spin coherence
- Optical readout
- Zeeman splitting = sensitivity to magnetic field
- Very sensitive: can detect a single electron spin \sim nms from NV centre!
- Non-invasive

SCANNING PROBES OF B: NITROGEN VACANCY MICROSCOPY

Maletinsky et al., Nat. Nano., 7, 320 (2012)

And now:

Commercial setups available:

Qnami, ProteusQ

Qzabre, QSM

NITROGEN VACANCY MICROSCOPY

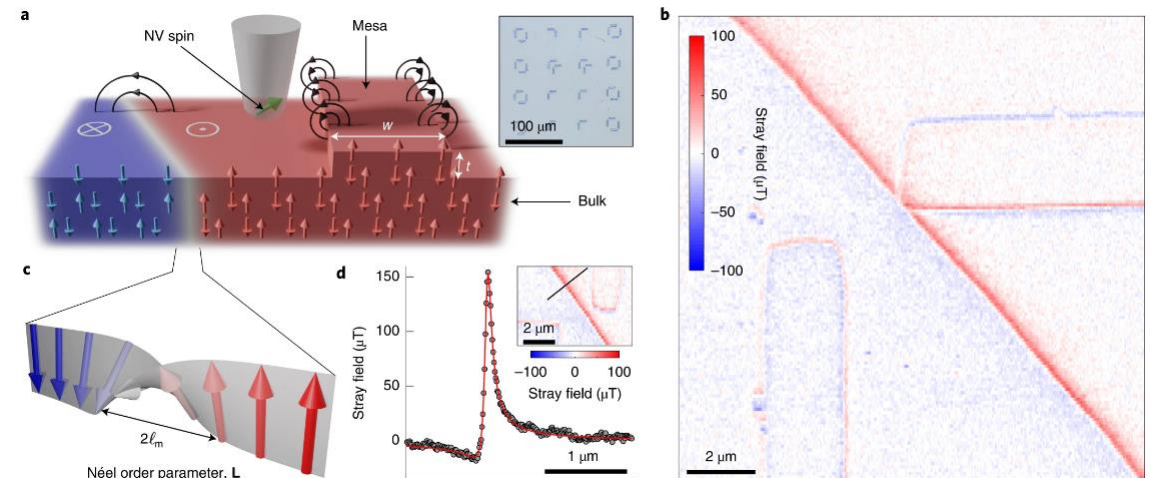

Ferromagnetic domain imaging:

Finco et al., PRL (2022)

Spatial resolution: determined by tip (distance to NV centre). Roughly 50 nm (down to ~10 nm)

Anti-ferromagnetic domains & domain walls:

Hedrich et al., Nature Physics (2021)

High sensitivity

NITROGEN VACANCY MICROSCOPY

Take Home Messages of NV Magnetometry

- *High spatial resolution imaging of magnetic surface charges*
- *Highly sensitive – can even measure antiferromagnetic domain walls!*
- *Limited to ~flat samples – new technique, continuous development –*

	NV Microscopy
Contrast	H , surface charges
Spatial resolution	10s of nm
Depth sensitivity	Surface sensitive
Sample environment	Field, ~cryo, electrical contacts (in dev.)
Invasive	No
Sensitivity	High!!
Cost/ accessibility	Lab-based, recent commercial examples

***B* probes**

***M* probes**

$$B = \mu_0(M + H)$$

Scanning probe

***Electron
microscopy***

ELECTRON MICROSCOPY OF B: TRANSMISSION ELECTRON MICROSCOPY

JEOL ARM 200F

In dedicated labs

Highly intense source of electrons

Capable of (non-magnetic) resolution with sub-atomic resolution

Mundy et al., Nature 537, 523 (2016)

ELECTRON MICROSCOPY OF B: TRANSMISSION ELECTRON MICROSCOPY

JEOL ARM 200F

In dedicated labs, millions of euros
Highly intense source of electrons
Capable of (non-magnetic) resolution with sub-atomic resolution

Lorentz

*Electron
holography*

MAGNETIC TEM: LORENTZ MICROSCOPY

Lorentz microscopy:

Transmission electron microscopy:

Electrons deflected by Lorentz force:

$$\mathbf{F}_{Lorentz} = q(\mathbf{v} \times \mathbf{B})$$

Togawa et al., Proc. SPIE 7036, Spintronics, 703617 (2008)

MAGNETIC TEM: ELECTRON HOLOGRAPHY

Electron holography

Aharonov-
Electrically
electromagnetic
change in
particle.

Togawa et al., Proc. SPIE 7036, Spintronics, 703617 (2008)

→ If you can reconstruct the phase of an electron, you can directly reconstruct the magnetic vector potential

→ In-plane components of magnetic field B

Spatial resolution: single digit nm

Wavelength of an electron \sim pm. Not the limiting factor!

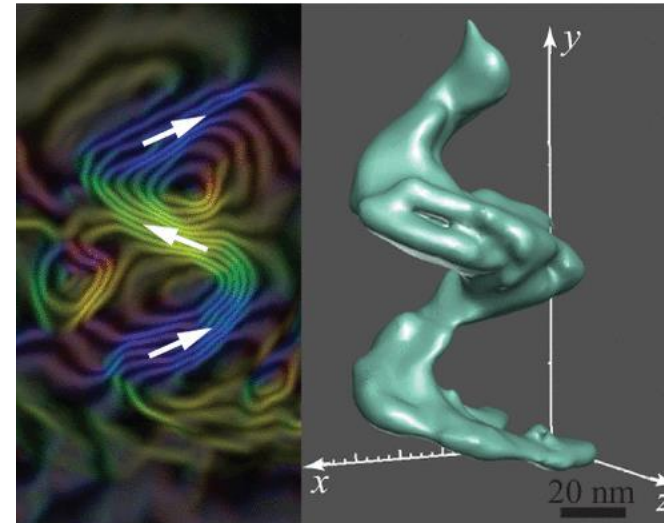

MAGNETIC TEM: ELECTRON HOLOGRAPHY

Magnetic skyrmions

Matsumoto et al., Science Advances (2016)

Cobalt nanospirals

Phatak et al., Nano Letters (2014)

Magnetic nanoparticles

Almeida et al., Science Advances (2016)

TRANSMISSION ELECTRON MICROSCOPY

Take Home Messages of Transmission Electron Microscopy

- **Very high spatial resolution imaging of magnetic induction**
(single digit nm)
- Probe of induction perpendicular to direction of propagation of electrons
- Can also provide high resolution imaging of atomic lattice
- Limited to 100nm thick samples – Application of in situ fields difficult –

	TEM
Contrast	$B \perp k$
Spatial resolution	Single digit nm (or below!)
Depth sensitivity	Thin samples $\sim < 100$ nm
Sample environment	\sim cryo, electrical contacts (in dev.). Fields challenging
Invasive	No
Sensitivity	Medium
Cost/ accessibility	Lab based, specialised equipment (10^6 €)

B probes

M probes

$$B = \mu_0(M + H)$$

*Optical
techniques*

*X-ray
microscopy*

IN THE LAB: MAGNETO-OPTICS

Durham Magneto Optics

Evico Magnetics

Table-top setup

Laser as source of photons

Relatively low cost, accessible

OBSERVING DOMAINS: MAGNETO-OPTICS

Circular polarised light:

Coupling of the
photon's angular momentum
to
angular momentum of an electron

Angular momentum = $\pm \hbar$

Dichroism: *Refractive index dependent on:
Circular polarisation and Direction of magnetisation*

Circular polarised light:

Superposition of linear H and V

$$|\pm\rangle = \frac{1}{\sqrt{2}}(|H\rangle \pm i|V\rangle)$$

Linear polarised light:

Superposition of circular C+ and C-

$$|H\rangle = \frac{1}{\sqrt{2}}(|+\rangle + |-\rangle)$$

OBSERVING DOMAINS: MAGNETO-OPTICS

Linear polarised light incident on magnetic material:

- *Rotation* of the linear polarisation
- Ellipticity of the light

Measure this rotation → probe the magnetisation // k

In transmission: Faraday effect

McCord J. Phys. D: Appl. Phys. 48 (2015) 333001

In reflection: Kerr effect

Spatial resolution:

limited by wavelength of light
~hundreds of nanometres

OBSERVING DOMAINS: MAGNETO-OPTICS

Linear polarised light incident on magnetic material:

- *Rotation* of the linear polarisation
- Ellipticity of the light

Measure this rotation → probe the magnetisation // k

Vector information:

Polar

Longitudinal

Transversal MOKE

MOKE MICROSCOPY

MOKE signal depends on \mathbf{k}

In-plane and out of plane domains

Soldatov & Schaefer, Review of Scientific Instruments 88, 073701 (2017)

Dynamic imaging of microstructures

Urs et al., AIP Advances (2016)

* Penetration depth of MOKE is approximately 10-20 nm for metals
 → Surface sensitive

MAGNETO-OPTICAL MICROSCOPY

Take Home Messages of Magneto-Optical Microscopy

- *~100s nm – um spatial resolution imaging of surface magnetisation*
- *Can distinguish orientations of the magnetisation!*
- *Can be combined with time-resolved imaging to probe dynamics, can combine with different sample environments*
 - *Limited to ~flat samples – can't resolve nm textures –*

	Magneto optics
Contrast	m
Spatial resolution	100s nm – μ ms
Depth sensitivity	Surface sensitive
Sample environment	Field, ~cryo, electrical contacts (in dev.), TR
Invasive	No
Sensitivity	High
Cost/ accessibility	Lab based, accessible

B probes

M probes

(Received 2 December 1991)

By combining L_2 and L_3 , can isolate spin and orbital moments

Relevant for new opportunities in orbitronics

Perspective

Orbitronics: Orbital currents in solids

NEWS AND VIEWS | 05 July 2023

First light on orbitronics as a viable alternative to electronics

An effect that transfers information using the rotational motion of electrons has been detected with light, forging a path towards technologies that are cheaper – and less harmful to the environment – than existing electronics.

[Tatiana G. Rappoport](#)

DONGWOOK GO^{1,2(a)}, DAEGEUN JO³, HYUN-WOO LEE³, MATHIAS KLÄUI^{2,4,5} and YURIY MOKROUSOV^{1,2}

CONTRAST

Magnetisation

*Element
specificity*

*Spin & Orbital
moments*

And the microscopy?

MAGNETIC MICROSCOPY: X-RAYS

Advantage of X-rays: highly penetrating, so can look through “thick” samples

Also disadvantage: small refractive index means hard to create optics!

Fresnel Zone Plate:

Nanofabrication determines spatial resolution

STXM (Scanning Transmission X-ray Microscopy)

Baumgartner et al., Nat. Nano. **12**, 980 (2017)

HIGH SPATIAL RESOLUTION: COHERENT DIFFRACTIVE IMAGING → *PTYCHOGRAPHY*

Take a large coherent beam, and measure coherent diffraction patterns for overlapping illuminations

→ Significant increase in spatial resolution, sensitivity

→ Reconstruct complex transmission function

Urquhart, ACS Omega 7, 11521 (2022)

DICHROIC X-RAY MAGNETIC PTYCHOGRAPHY

Take a large coherent beam, and measure coherent diffraction patterns for overlapping illuminations

Apply to magnetic imaging:

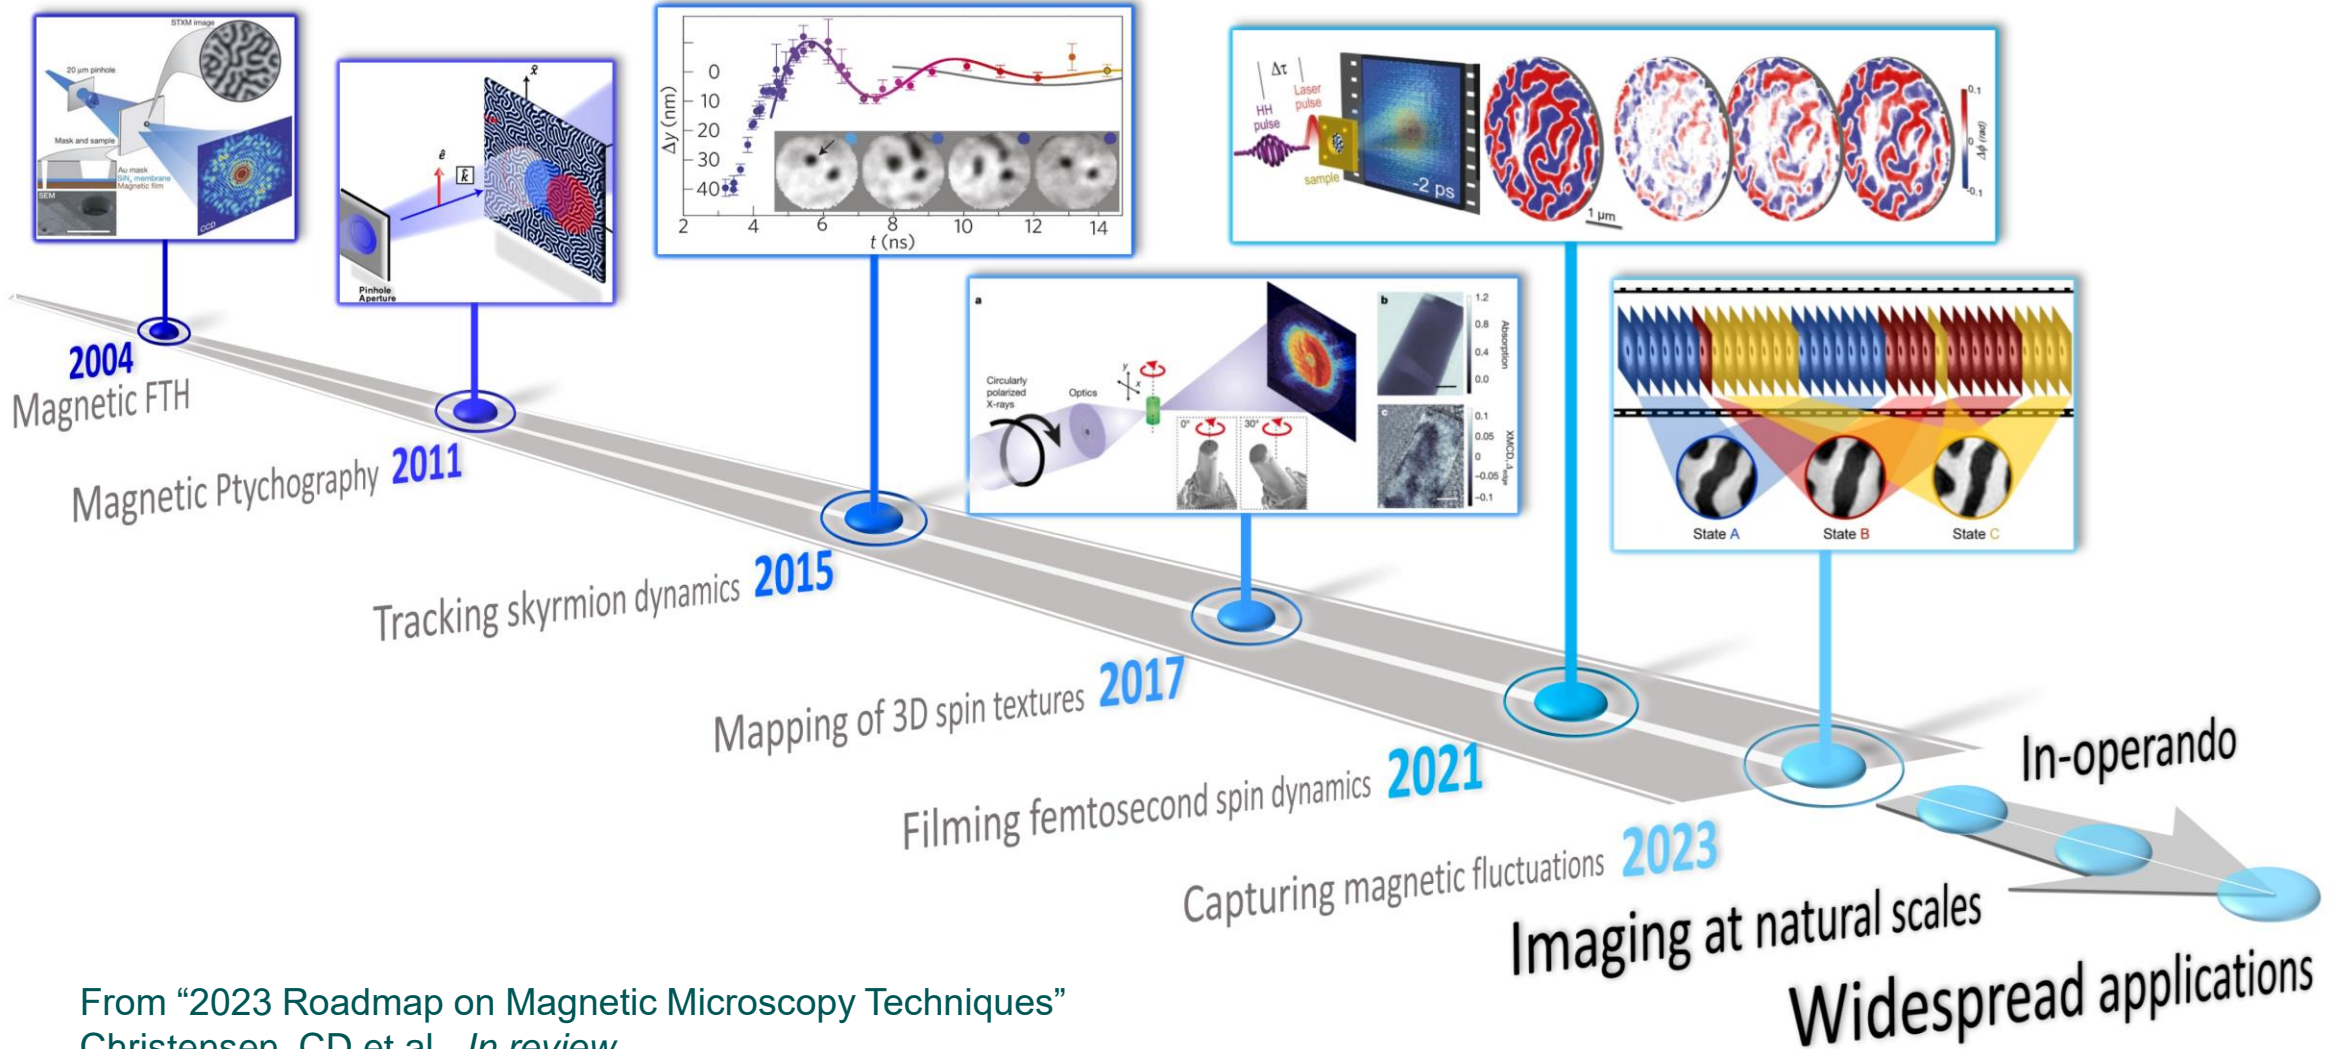

7 nm spatial resolution imaging of magnetotactic bacteria:

→ Reconstruct complex transmission function

Hitchcock, Journal of Electron Spectroscopy and Related Phenomena 200, 49 (2015)

COHERENT IMAGING: EXCITING THINGS TO COME!

From “2023 Roadmap on Magnetic Microscopy Techniques”
Christensen, CD et al., *In review*

X-RAY MAGNETIC MICROSCOPY: XMCD

Take Home Messages of Synchrotron X-ray microscopy: XMCD

- *High spatial resolution imaging of magnetisation*
- *Element-specific – can target different elements in a sample*
 - *Can penetrate through thick samples, up to micrometres*
- *Can combine with time-resolution to probe picosecond dynamics*
 - *Requires submission of beamtime proposal for user beamtime –*

	X-ray magnetic circular dichroism
Contrast	$m \parallel k$
Spatial resolution	10s nm (& below!)
Depth sensitivity	nm - μms
